

Python in Excel Demo Day

What to remember on Monday

A one-page memory aid from today's session. Pin it next to your monitor.

01

The rule

PY cells calculate top to bottom, left to right.

Put imports and variables in the **top-left**.

Build down and right from there.

02

The bridge

`xl()` pulls an Excel table into pandas:

```
sales = xl(
    "sales[#All]",
    headers=True)
```

Then `.describe()`, `.value_counts()`, and `.groupby()` all work.

03

The chart

Three lines for a chart Excel can't make natively:

```
import seaborn as sns
```

```
sns.heatmap(
    sales.corr(
        numeric_only=True),
    annot=True,
    cmap='RdBu_r')
```

ONE LINE TO REMEMBER

`.groupby()` is a PivotTable, spelled in code. Split, apply, combine.

Three places to go next

01 · THE BOOK

Advancing into Analytics

From Excel to Python and R. O'Reilly Media. The long-form mental model from today.

-> stringfestanalytics.com/book

02 · THE MEMBERSHIP

Modern Excel + AI Skills

Today's recording lives here, plus the full workshop catalog and workbook library.

-> stringfestdata.gumroad.com//mxltais

03 · THE NEWSLETTER

Stringfest weekly

One short email each week on getting more from Excel.
